```
Unging Source takes in the control of mice (Strain Markey); processing mouse I (variant A.9) cells.

The parvoviridae family cantains two groups that infect mammalian hosts: (i) defective (helper-dependent) adeno-associated viriuses, and (ii) autonomous (helper-independent) parvoviruses. MVM is a member of the latter group. Both groups have been demonstrated to package both plus and minus strands (in separate particles) of the ss. DNA genome, though the minus strand is more typically packaged in the latter group.

The sequence below corresponds to the plus (+) strand, also referred to as the C-strand. The minus (-) strand is also referred to as the V-strand.

The 3' and 5' termini both exhibit the potential for forming stable 'fold-back' hairpins; these sequences appear to play a role in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VRL 22-MAY-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         replication [1].
The left and right halves of the genome encode two distinct, but overlapping transcriptional units. The transcripts can be summarized [1] (1 map unit (mu) = 51 bp):
R1 (4.8 kb): 4.5 mu - 46 mu; 46+ mu - 95 mu
R2 (3.3 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu
R3 (3.0 kb): 40 mu - 46 mu; 46+ mu - 95 mu
R3 is the major transcript.
R3 is the wajor open anding frames, both on the plus (or C) There are two majors open reading frames, both on the plus (or C) strand. The left side ORF (261-2279) probably encodes a non-capsid protein of 85 kd; the right side ORF probably encodes the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Three splicing patterns are used to excise the small intron common to all minute virus of mice RNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3783817 Original source text: Minute virus of mice (strain MVM(p)), passed

capsid proteins, VPI (or A, 83 kd), VP2 (or B, 64 kd), and VP3 (or C, 61 kd). But because of uncertainties about the precise splice points in the transcripts, the exact starts, stops and (possible) intron boundaries are not known.

The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene
                                                                                                                                                                                            9
                                                                                                                                                                                                                 9
                                The present sequence is a parvovirus non-structure protein 1 (NS1) variant ($283A) DNA fragment. The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a DNA encoding parvovirus non-structure protein 1 (NS1) variant (T363A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cyclocxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)

The present sequence is a DNA encoding parvovirus non-structure protein 1 (NS1) variant (T394A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a DNA encoding parvovirus non-structure protein (NSI) variant (1463A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-ANG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

                                                                                                                                              This viral DNA is isolated from a non- attenuated CPV. The DNA is preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM3Z or pGEMSZ. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or canine A72 cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a wild type DNA encoding parvovirus non-
structure protein 1 (NS1). The present invention relates to the variants
of the parvovirus non-structure protein (NS1) having a shifted
equilibrium between the DNA replication and transcription activities, and
the cytotoxicity activity. These variants are useful as toxins for
treating tumoural diseases. The variant DNAs are useful as vectors for
gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GAAGTITCTAITAAAACTACACTTAAAGGCTGGTGCATAAAAGGGTAAACCTCACCAGAG 900

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Attenuated viruees are obtained by serial passage of the virulent CPV type 2b isolate 39 in NLFK feline kidney host cells. They have one or more of the sequence alterations indicated in the sequence relative to the sequence of a control (5th passage) wild-type CPV-2b (see AAT88320). A claimed virus from the 65th passage (deposited as ATCC W 2528) contains all 6 mutations. The DNA from attenuated CPV strains (see also AAT88324) is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dogs as a vaccine to protect against CPV disease, or more generally in cats and minks to protect against feline patheukopenia virus and mink enterettis virus. The variations where the virus and minks to the variation of the virus and minks to the variations and virus and minks to the variations and virus and minks to virus.

This DNA sequence comprises an attenuated virus genome derived by serial passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate 23 in NuEK feline kidney host cells. The attenuated virus is designated vB1440 (ATCC VR 2489). It contains 4 mutations relative to the sequence (see AAT88320) of the control (5th passage) wild-type CPV-2b. 2 mutations are within the hairpin formed by the 3' terminal palindrome: the mutation at nucleotide 59 introduces an A into a G-C rich region within the tip of the hairpin, disrupting the base pairing in one of the 2 small internal palindromes within that sequence; the thymine at nucleotide 97 is the mainstached bubble (flip-flop) sequence within the palindrome. The DNA from attenuated CPV strains (see also AAT88321) is used for the production of infectious molecular DNA clones, which, in the trun, can be transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dags as a vaccine to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strants of types 2 and 2a), providing a long term immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                     Canine parvovirus DNA carrying specific attenuating mutation(8) - used as vaccines for protection against parvovirus and feline pan-leukopenia virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 5049 BP; 1791 A; 812 C; 1029 G; 1417 T; 0 U; 0 Other;

```
This DNA sequence comprises the genome of virulent canine parvovirus type 2b (CPV-2b) isolate 39, obtained after 5 serial passages in NLFK feline kidney host cells. Further passaging has yielded attenuated virus vBI440 (ATCC VR 2489) (see AAT88324) from the 66th passage, and a claimed virus (see AAT88321) derived from the 65th passage (ATCC 2528). These (see AAT88321) derived from the 65th passage (ATCC 2528). These passage virus. The DNA from attenuated CPV-2b strains is used for the passage virus. The DNA from attenuated CPV-2b strains is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The cattenuated viruses can be used in dogs as a vaccine to protect against cattenuated virus and mink enteritis virus. The vaccines protect against companially in cats and minks to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strains of types 2 and 2a), and provide a long term immune response. (Updated on 17-0003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1116 GAAGTGTCAATCAAATGTACTTTGCGGACTTGGTTAATAAAAGAGTAACATCACCTGA 1174

Canine parvovirus; type 2b isolate 39.

Canine Eeline Gene #2617 used to diagnose liver cancer.

```
the invention relates to an isolated muciest acid compitising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide of its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway capable of proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiocic; (10) profiling a compound that inhibits proliferation of the test compound that inhibits proliferation of the strains is present in a culture or collection of the compound; a compound; so exemptions of the strains is present in a culture or collection of the strains is present in a culture or collection of the strains is present in a culture or collection of the strains in spressing the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for dentifying proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids actional corpusants or the screening homologous nucleic acids required for proliferation or or lessented molecules for rational corpusants or or objections or or or or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                K. pneumoniae or P. aeruginosa. The present sequence is one of the margin prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed precipilation.
                                                                                                                                                                                                                                                                                                                                                                                                                                            screening

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN3503.ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, and positive, drug efficacy and drug metabolism. Note: The sequence data for this patent did not form par of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 GAAGTIGCTATTAAAACTACACTTAAAGAGCTGGTGCATAAAAGAGTAACCTCACCAGA 59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Acetyl-coenzyme-A-carboxylase; acetyl-CoA-carboxylase; ACCase; transgenic plant; oilseed; crop improvement; fatty acid; polyhydroxyalkanoate; poly-beta-hydroxyalkanoate; herbicide resistance; pesticide resistance; polyhos

A cDNA clone of rapeseed, identified as encoding ACCase, was used to probe a genomic library prepared from A. thaliana. The 5' sequence of an isolated subclone, pKLU81, was determined. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                               /*tag= c

```
The sequence represents the 5' end of subclone pKLUB1 (NCIB 40555)
cncoding the Arabidopsis thaliana acetyl Coenzyme A carboxylase (ACCase)
cncoding the Arabidopsis thaliana acetyl Coenzyme A carboxylase (ACCase)
cnbA, which can be used to create a sense or an antistense expression
cassette to transform rape and other oilseed plants (canola, soybean,
sunflower) to downregulate production of the ACCase enzyme. The
cransgenic plants have a lower or a modified oil content. Down-regulation
of oil synthesis can be used to divert the substrate, acetyl Coenzyme A,
into synthesis of alternative storage materials (starch, protein or novel
polymers e.g. polybydroxyalkanoates). Full-length ACCase clones can be
used to create transgenic plants over-expression in monocot plants such
as wheat, barley, maize and rice, which are normally sensitive to
herbicides resistance in the transgenic plants (dicocs are normally
cherbicide resistance in the transgenic plants (dicocs are normally
resistant to these herbicides). (Updated on 16-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                              Once-lorgan: Petiole; Vector: pDNR; Site 1: Sfil; Site 2: Sfil; CAP is a cDNA library of Vitis vinifera cv. Cabernet Sauvignon. Clone 8 petioles. Samples were collected on July 10, 2002 from plants on the onset of Veraison (berry softening). Sampled vines were located the University of California, Davis, Experimental Vineyard. cDNAs were made by oligo-dT priming and directionally cloned. 5' and 3' adaptors were used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CA12E1301IIR G12 Cabernet Sauvignon Leaf - CA12E1 Vitis vinifera cDNA clone CA12E1301IIR_G12 3', mRNA sequence.

/clone libe Cabernet Sauvignon Leaf - CA12EI"
/clone libe Cabernet Sauvignon Leaf; Vector: pDNR; Site 1: Sfil; Site 2:
Sfil; CA12EI is a cDNA library of Cabernet Sauvignon
leaves. The leaves were collected on July 25, 2001, in
Napa Valley, California, and represent leaves in
mid-season development. These leaves were verified to be
infected with the bacterial pathogen, Xylella fastidiosa,
based on a diagnostic assay using PCR and Xylella-specific
primer pairs. The plants were asymptomatic at the time of
collection, but later developed symptoms. CDNAs were made
by oligo-dT priming and directionally cloned. 5' and 3'
adaptors were used in cloning as follows:
5'-AACCAGTATCAACGCAGAGTGGCCATTACGGCCGGG-3' and
5'-AATCTAGAGGCGGGCGCACATGCGCCATTACGCCGGG-3' and
size-selected using the Clontech Creator SMART kit and
size-selected to contain the 0.5-3 kb size fraction."

Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (~2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Ventrer, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome .
Sequencing: A Practical Approach, eds. M. Vaudin and B.

/dionalibe Entamobed histolytica Sheared DNA"
/note="Vector: pH081; Site 1: Bat 1; Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (~2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)." Entranceba histolytica

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2411, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001
CURRENT FILING DATE: 2000-04-05
PRIOR APPLICATION NUMBER: US 60/128,706
PRIOR APPLICATION NUMBER: US 60/128,706
PRIOR PILING DATE: 1999-04-09

Publication No. US20030204075A9

GENERAL INFORMATION:

APPLICANT: Wang, David G.

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

TITLE OF INVENTION: Polymorphisms in the Human Genome

FILE REFERENCE: 108827.129

CURRENT APPLICATION NUMBER: US/10/027,632

CURRENT FILING DATE: 2002-04-30

PRIOR PAPLICATION NUMBER: US 60/198,676

Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

Disclosure; Page 14; 41pp; English.

The present sequence is a peptide fragment of parvovirus non-structure protein 1 (NS1) variant (S283A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the

The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The present sequence is parvovirus non-structure protein 1 (NSI) variant (T394A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The present sequence is parvovirus non-structure protein 1 (NS1) variant (7854A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is parvovirus non-structure protein 1 (NS1) variant (T463A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
